Jenkins is an open source automation tool written in Java with plugins built for Continuous Integration purpose. Jenkins is used to build and test your software projects continuously making it easier for developers to integrate changes to the project, and making it easier for users to obtain a fresh build. It also allows you to continuously deliver your software by integrating with a large number of testing and deployment technologies.

Installation Steps for Jenkins on Ubuntu 18.04

Step 1-: Update ubuntu repository

$sudo apt get update

Step 2-: Install Java development kit

$sudo apt install default-jdk

Step 3-: Download the latest jenkins .deb file from jenkins.io website by selecting ubuntu distribution.

Once downloaded, double click on file and open with software centre. Click on install button to perform installation.

Once Installation is done, you can test the jenkins on http://localhost:8080 on the browser.
First time, when you open jenkins portal it will ask to put admin default password which is stored in /var/lib/jenkins/secrets/initialAdminPassword file.

So, open the file through terminal and get the password for configuring jenkins for the first time.

Now, copy the password and add into the portal and click on install plugins to install selected plugins.

Once plugins are installed, click on next and specify the admin details along with the new password for jenkins admin and click on finish to complete the installation.

Once installation is done, open Jenkins dashboard using http://localhost:8080 address.

So, by providing the right credentials you can access jenkins dashboard as shown below.
